

RMB28 / RMF44 angular magnetic encoder modules

The images do not represent all variants.

The RMB28 encoder module is designed for direct integration into high volume OEM applications. The inexpensive 28 mm square PCB can also be supplied with a connector or as RMF44 on a metal flange with 44 mm diameter for easy mounting.

The encoder module consists of a magnetic actuator and a separate sensor board. The rotation of the magnetic actuator is detected and processed by a custom encoder chip mounted on the sensor board to obtain the desired output format. The output signals are provided in industry standard absolute, incremental, analog or linear voltage output formats.

The RMB28 and RMF44 encoder modules can be used in a wide range of OEM applications, including motor control and industrial automation.

Product range

RMB28AC / RMF44AC

Analogue sinusoidal output with a single sine/cosine period per revolution.

RMB28DC / RMF44DC

BiSS-C interface with up to 8,192 counts per revolution and optional revolution counter.

RMB28I / RMF44I

Incremental with up to 2,048 counts per revolution (320 to 8,192 counts per revolution with x4 evaluation).

RMB28MD / RMF44MD

Sine/Cosine + Absolute binary synchro-serial + Incremental, 5V.

RMB28SC / RMF44SC

Synchro serial interface (SSI) with up to 8,192 counts per revolution.

RMB28SI / RMF44SI

Synchro serial interface (SSI) and incremental outputs.

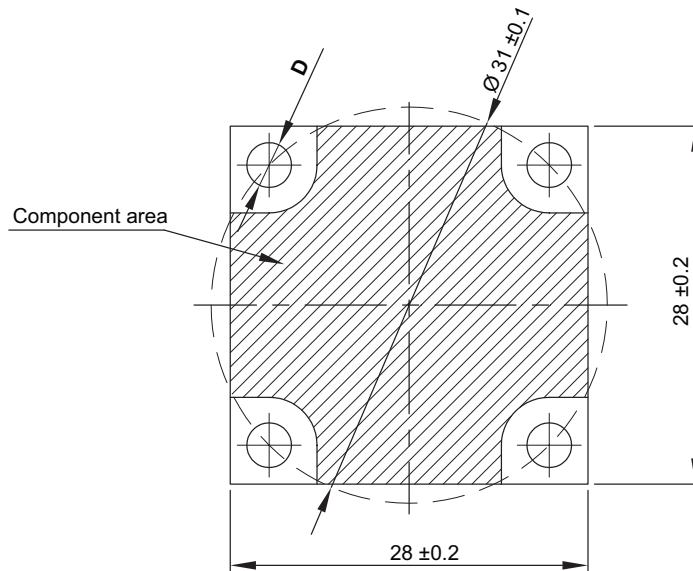

RMB28Vx / RMF44Vx

Linear voltage output in a range of variants.

- 28 mm square module with the option of 44 mm diameter metal flange
- Inexpensive solution for OEM integration
- 5 V and 24 V power supply versions
- High speed operation to 60,000 rpm
- Absolute - to 13 bit resolution (8,192 counts per revolution)
- Industry standard absolute, incremental, analogue, commutation and linear voltage output formats
- Accuracy to $\pm 0.5^\circ$
- RoHS compliant (lead free) - see Declaration of conformity

Timing diagram – BiSS C

Data	Length	Description
P11 – P0	0 or 12 bit	Revolution counter value when enabled (see Part numbering/ resolution)
S12 – S0	7 to 13 bit	Position inside the revolution (length depends on the resolution)
E1 – E0	2 bit	Error data
CRC5 – CRC0	5 to 6 bit	Cyclic redundancy check data; polynomial 0x43; inverted bit output

Error	E0	E1
No error	1	1
Amplitude error	0	1
Too high velocity	1	0
Undervoltage; Configuration; System error	0	0

* The revolution counter counts the number of mechanical revolutions of the shaft or magnet of the encoder. Counting is possible only when the encoder is powered. When the encoder is powered off, the revolution counter is reset to 0.

The digital relative angular position information is converted into linear voltage with a built-in 10 bit D/A converter. The linear output voltage swing ranges from 0 V and V_{dd} (5 V). The number of periods within one revolution (N_{period}) can be 1, 2, 4 or 8, representing one full swing over an angle (φ_{period}) of 360°, 180°, 90° or 45° respectively. The signal is made up of steps which represent the angular movement needed to register a change in the position (φ_{step}) and the resulting change in the output voltage (V_{step}). The number of steps in one period (N_{step}) is given in the table below.

For clockwise rotation of the magnetic actuator, the output voltage increases. For counterclockwise rotation, the output voltage decreases.

Timing diagram for linear voltage output

$$\varphi_{\text{step}} = \frac{\varphi_{\text{period}}}{N_{\text{step}}} \quad V_{\text{step}} = \frac{V_{\text{dd}}}{N_{\text{step}}}$$

φ_{period} = Angle covered in one period (one sawtooth)

V_{period} = Output voltage range for one period

φ_{step} = Step angle (angular movement needed to register a change in the position)

V_{step} = Output voltage range for one step

N_{period} = Number of periods in one revolution

N_{step} = Number of steps in one period

φ_{period}	N_{period}	N_{step}	φ_{step}
360°	1	1024	0.35°
