

Orbis[™] true absolute rotary encoder

Orbis[™] is a true absolute rotary encoder suitable for applications where a typical OnAxis encoder cannot be mounted at the end of the rotating shaft due to space constraints.

The encoder comprises a diametrically magnetized permanent ring magnet and a printed circuit board. Geometric arrangement of 8 RLS' proprietary Hall sensors on a PCB enables generation of one period of sine and cosine signals per mechanical magnet revolution. Moreover, it also enables cancellation of third harmonic component that becomes nonnegligible at low magnet ride height.

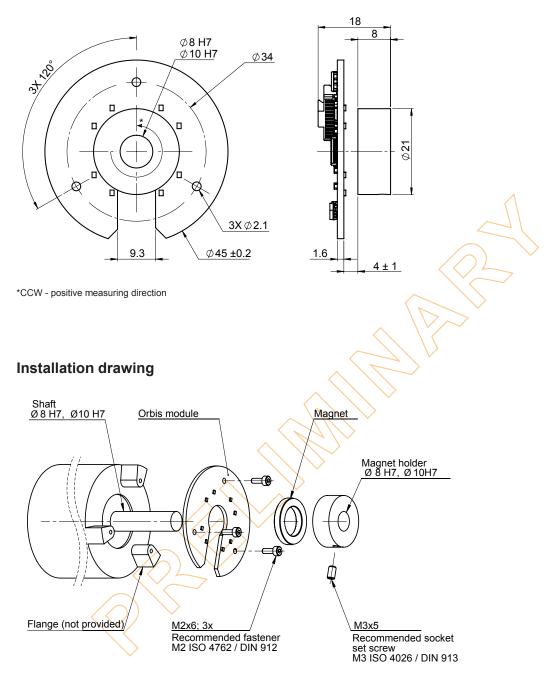

An adaptive filtering function ensures high resolution at low rotation speeds and low angle phase delay at high rotational speeds. Orbis[™] also features an additional built-in selfcalibration algorithm that improves encoder's accuracy after installation.

Orbis[™] through-hole measuring principle allows customisation with various board and magnet sizes to suit your application.

- True absolute encoder
- 14 bit resolution
- Multi-turn counter option
- 8 proprietary Hall sensor ASICs
- Through-hole design enables its mounting anywhere along the shaft
- Self-calibration after assembly
- Buit-in self-diagnostics
- Status LED
- SPI, SSI, BiSS-C, PWM, and asynchronous serial communication
- Wide installation tolerances

Dimensions

Dimensions and tolerances in mm.

Technical specifications

•	
System data	
Reading type	Axial reading
Resolution	14 bit
Maximum speed	10,000 rpm
Freedor	< ±0.3° (final)
Encoder accuracy	< ±1° (beta samples)
Hysteresis	No magnetic hysteresis
Repeatability	< ±2 LSB
Electrical data	
Supply voltage	4 V to 6 V
Set-up time	< 2 ms
Power consumption	< 80 mA
Output load	PWM, SPI Max. ±20 mA at 3.3 V
Output load	RS422 120 mA short term, 60 mA limited
ESD protection	HBM, Class 2, max. ±2 kV (as per Mil-Std 883 Method 3015.7)
Mechanical data	
Available magnet size	OD: 19 mm, ID: 12 mm, thickness: 3 mm (other magnet sizes possible)
Available adapter sizes	8 mm
(inner diameter)	10 mm
Encoder outer diameter	45 mm (customisation possible)
Encoder hole diameter	13 mm (customisation possible)
Environmental data	
Operating tomporature	–40 °C to +105 °C (final)
Operating temperature	0 °C to +60 °C (beta samples)

Status indicator LED

The LED provides visual feedback of signal strength, error condition and is used for set-up and diagnostic use.

LED	Status
Green	Normal operation; position data is valid.
Orange	Warning; position is valid, but some operating conditions are close to limits.
Red	Error; position data is not valid.
No light	No power supply.
No light	No power supply.

Multi-turn counter

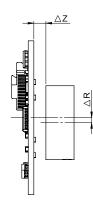

Multi-turn counter is available as an option on the following communication interfaces: BiSS, SSI, SPI and Asynchronous serial communication. Multi-turn counter is 16 bit (0 to 65535 counts). Counting is available only when the encoder is powered on, but the counter state is stored in a non-volatile memory at power off and is restored at power up.

Installation instructions

Installation tolerances

Precise magnet and board positioning is key to achieving good overall accuracy.

Axial (ΔZ) displacement (ride height)	4 mm nominal ±1 mm
Radial (ΔR) displacement	0.3 mm

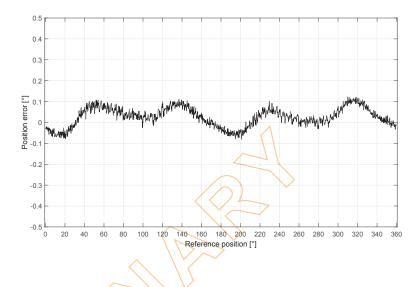

Axial position adjustment (ride height)

The nominal gap between the permanent magnet and the printed circuit board (opposite side of connector) is 4 mm ±1 mm. Any non-magnetic tool with 4 mm thickness can be used to check the correct ride height setting mechanically. The integrated LED can be used as a coarse indicator. When the correct ride height is achieved, the LED glows green and does not change colour when the magnet rotates.

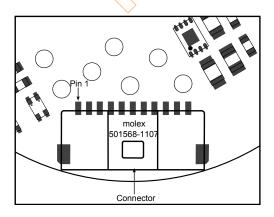

A typical accuracy plot after good installation of Orbis encoder is shown in the graph on the right.

For highest accuracy options contact RLS.

Electrical connections

Pin	Wire Colour	Asynchronous serial	PWM	SSI	BiSS-C	SPI

Communication interfaces

Asynchronous serial communication interface

Asynchronous serial communication is supported by a universal asynchronous receiver/transmitter commonly known as UART. It comprises two unidirectional communications channels, forming a full-duplex bidirectional data link. Every channel consists of a two wire differential twisted-pair connection conforming to the RS422 signalling standard.

Electrical connection

* The Command and Data signals are 5 V RS422 compatible differential pairs with RC termination inside the readhead.

Communication parameters

Character length	8 bits
Parity	None
Stop bits	1
Flow control	None

Communication speed is set with the Communication interface variant in the part number:

Communication interface variant	A	$\left \right $	В	С	D	E	F
Value [kbps]	115.2	\setminus	128	230.4	256	500	1000

Command set

Command "	1" (0x31) – position request
Response	1 byte ASCII "1" 2 bytes (4 for multi-turn) hex – see Encoder position data structure
Command "	d" (0x64) – position request + detailed status
Response	1 byte ASCII "d" 2 bytes (4 for multi-turn) hex – see Encoder position data structure 1 byte hex – see Detailed status data structure
Command "	s" (0x73) – position request + speed
Response	1 byte ASCII "s" 2 bytes (4 for multi-turn) hex – see Encoder position data structure 2 bytes hex – speed (in revolutions per second multiplied by 10)
Command "	t" (0x74) – position request + temperature
Response	1 byte ASCII "t" 2 bytes (4 for multi-turn) hex – see Encoder position data structure 2 bytes hex – temperature (temperature of the readhead in °C multiplied by 10)
Command "	v" (0x76) – serial number
Response	1 byte ASCII "v" 6 bytes ASCII – serial number

Encoder position data structure

Encoder p	osition	
k	o31 : b16	Multi-turn counter (optional) - Left aligned, MSB first.
k	o15 : b2	Encoder position – Left aligned, MSB first.
General st	atus	
k	o1	Error - If low, the position data is not valid. The last valid position is sent out.
k	00	Warning - If low, the position data is valid, but some operating conditions are close to limits.
T 5	The colour 50 %, frequ	Varning bits can be set at the same time, in this case the Error bit has priority. of the LED on the readhead housing indicates the value of the General status bits. LED is flashing (duty cycle uency 2.5 Hz), when the encoder is in idle state. If the controller requests the data every 200 ms or more often cle of the LED is 100 % (always on).
Detailed st	tatus	
k	o7	Signal amplitude too high. The readhead is too close to the magnet or an external magnetic field is present.
k	o6	Signal amplitude low. The distance between the readhead and the ring is too large.
k	o5	The readhead temperature is out of specified range.
t	o4	Speed too high.
k	o3 : b0	Reserved.

PWM - Pulse width modulation interface

The PWM interface transmits the information about the absolute angle position over the pulse width modulated PWM Out signal. An additional digital Status signal indicates the encoder's error condition.

Electrical connection

The Status and PWM Out signals are 3.3 V TTL compatible. These signals have weak ESD protection. Handle with care. Maximum current sourced from or sunk into signal lines should not exceed 20 mA.

Status signal

The Status signal indicates the current status of the encoder. The Status signal is high for normal operation and valid position information. The low state of the Status signal indicates an error state of the encoder which can be caused by:

- Operation outside the installation tolerances
- Sensor malfunction
- System error
- No power supply

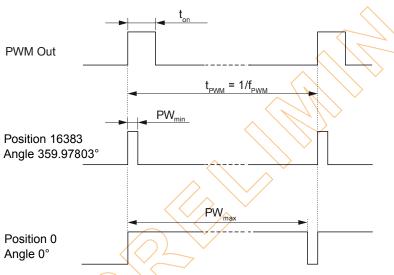

When the Status signal is low, the PWM Out signal is low and no pulses are output.

The encoder position is latched on the rising edge of the PWM Out signal. The Status signal should also be checked at the rising edge of the PWM Out signal. If the Status signal changes during the PWM period, it does not affect the currently transmitted position information.

PWM Out signal

The PWM Out is a pulse width modulated output with 14-bit resolution whose duty cycle is proportional to the measured position. The change of the pulse width by PW_{min} corresponds to a change in position by one count (change in angle for 360° / 65536 \approx 0.00549°).

PWM Out signal timing diagram

Communication parameters

Communication interface variant in the part number defines the PWM frequency and all other dependent parameters.

	Communication interface variant					
Parameter	Symbol	Α	D	E	Unit	Note
PWM frequency	f _{PWM}	122.07	549.32	1098.63	Hz	
Signal period	t _{PWM}	8192	1820.44	910.22	μs	
Minimum pulse width	PW_{min}	0.5	0.111	0.0556	μs	Position 0 (Angle 0°)
Maximum pulse width	PW_{max}	8191.5	1820.33	910.17	μs	Position 16383
Min. counter frequency	f _{cntr}	2	9	18	MHz	
Resolution		14	14	14	Bit	

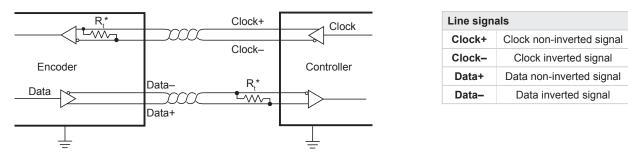

Position [counts] =
$$\frac{(t_{on} - PW_{min}) \times 16383}{PW_{max} - PW_{min}}$$

SSI - Synchronous serial interface

The encoder position, in 14 bit natural binary code, and the encoder status are available through the SSI protocol. The position data is left aligned. After the position data there are two general status bits followed by the detailed status information.

Electrical connection

* The Clock and Data lines are 5 V RS422 compatible differential pairs. The termination resistor on the Clock line is integrated inside the encoder. On the controller's side of Data line it should be added by the user or enabled in the controller.

The controller requests the position and status data of the encoder by sending a pulse train to the Clock input. The Clock signal always starts from high. The first falling edge of the Clock latches the last position data available and on the first rising edge of the Clock the most significant bit (MSB) of the position is transmitted to the Data output. The Data output should then be read on the following falling or rising edge. On subsequent rising edges of the Clock signal the next bits are transmitted.

After the transmission of the last bit the Data output goes to low. When the t_M time expires, the Data output goes high. The Clock signal must remain high for at least t_p before the next reading can take place.

While reading the data, the half of a Clock period t_{cL} must always be less than t_{M} . However, reading the encoder position can be terminated at any time by setting the Clock signal to high for the duration of t_{M} .

Communication parameters

Parameter	Symbol	Min	Тур	Max
Clock period	t _{c∟}	2 µs (400 ns *)		15 µs
Clock frequency	✓ f _{c∟}	70 kHz		500 kHz (2.5 MHz *)
Delay first clock	t _{FC}	1.25 µs		
Transfer timeout	t _M		16 µs	
Pause time	t _P		20 µs	

* With Delay First Clock function of the controller.

	b6	Signal amplitude low. Th	e distance between the readl	nead and the ring is too large						
	b5	The readhead temperatu	ure is out of specified range.	$\langle \rangle$						
	b4	b4 Speed too high.								
	N-T	opeed tee mgm								

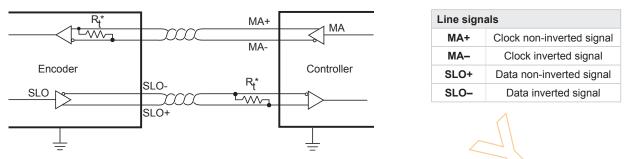

BiSS-C interface

The encoder position, in 14 bit natural binary code, and the encoder status are available through the BiSS-C protocol. The position data is left aligned. After the position data there are two status bits (active low) followed by CRC (inverted).

BiSS is implemented for point-to-point operation; multiple slaves are not supported.

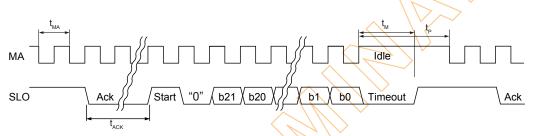

Communication is unidirectional, the readhead is not user programmable, also custom parameters can not be stored into the readhead.

Electrical connection

* The MA and SLO lines are 5 V RS422 compatible differential pairs. The termination resistor on the MA line is integrated inside the encoder. On the controller's side of SLO line it should be added by the user or enabled in the controller.

BiSS-C timing diagram (single-turn)

MA is idle high. Communication is initiated with first falling edge. The encoder responds by setting SLO low on the second rising edge on MA. When the encoder is ready for the next request cycle it indicates this to the master by setting SLO high. The absolute position and CRC data is in binary format, left aligned, MSB first.

Communication parameters

Parameter	Symbol	Min	Тур	Мах
MA period	t _{MA}	250 ns		15 µs

SPI - Serial peripheral interface (slave mode)

The Serial Peripheral Interface (SPI) bus is a four wire bidirectional synchronous serial communication interface, typically used for short distance communication. It operates in full duplex mode, where master (controller) selects the slave with CS line, generates clock signal on SCK line, sends command over MOSI line and receives data over MISO line.

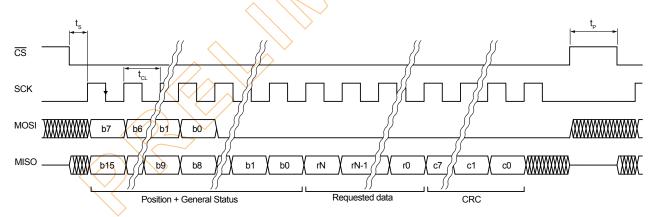

Electrical connection

All data signals are 3.3 V LVTTL. Inputs are 5 V tolerant. Maximum current sourced or sunk from signal lines should not exceed 20 mA.

CS	Active low. CS line is used for synchronisation between master and slave devices. During communication it must be held low. Idle is high. When CS is high, MISO line is in high-Z mode. This allows connection of multiple slaves in paralell, sharing all lines except CS.
SCK	Serial clock. Shifts out the data on rising edge.
MOSI	Master output -> Slave input. Command from the controller to encoder.
MISO	Master input — Slave output. Data is output on rising edge on SCK after CS low. When CS is high, MISO line is in high-Z mode.

SPI timing diagram (single-turn)

Controller starts the communication by setting the \overline{CS} signal low. The last available position data is latched at the same time. A delay of t_s is required for the encoder to prepare the data which is shifted to MISO output on rising edges of clock signal SCK. The command is received on 8 consecutive rising edges of SCK starting with the second rising edge. 16 bits of Position and General Status (active low) data are sent out regardless of the received command. The following Requested data length as well as the content depends on the command. The last eight bits contain CRC (inverted) of the complete data packet.

Communication parameters

Parameter	Symbol	Min	Тур	Max
Clock period	t _{cL}	250 ns		20 µs
Clock frequency	f _{cL}	50 kHz		4 MHz
Time after \overline{CS} low to first SCK rising edge	t _s	1.25 µs		
Pause time	t _P		5 µs	

Structure of data packet

Bit	b31 : b16	b15 : b2	b1 : b0	rN : r0	c7 : c0
Data length	16 bits	14 bits	2 bits	Variable	8 bits
Meaning	Multi-turn counter (optional)	Encoder position	General status	Requested data	CRC

	b31 : b16	16 Multi-turn counter (optional) - Left aligned, MSB first.			
	b15 : b2	Encoder position - Left aligned, MSB first.
