

MR Bonded Radial Incremental Magnetic Rings

The robust RLS radial magnetic incremental rings consist of an elastoferrite layer firmly bonded on a stainless steel hub. The elasto-ferrite layer is magnetised with 2 mm long alternating magnetic poles, which form an incremental magnetic pattern.

A unique or distance-coded (DCRM) reference marks option can also be added to the incremental magnetic pattern. Radial magnetic rings offer reliable solutions for high performance applications. VARIOUS SIZES AND MOUNTING OPTIONS

> ROBUST DESIGN

HIGH OPERATING SPEED

Features and benefits

- Non-contact technology
- Compatible with RLS LM and RoLin family readheads
- High speed operation

- Easy mounting
- Different shaft diameters available
- Excellent resistance to dirt and dust
- Unique or periodic reference mark

General information

The bonded radial incremental magnetic rings are a reliable solution for high performance applications. They can be installed with fasteners, by press-fitting or by gluing.

To assure safety and reliability at high speeds and temperatures, the rings can optionally be covered with a protective stainless steel foil. For maximum protection and use in particulary harsh environments, the cover foil can be fully welded to the ring. This protective layer also protects the elasto-ferrite from swarfs (e.g. metal, stone, glass, wood, etc.), chemical fluids (oils, coolants, grease, etc.) and minimises the influence of ageing (e.g. UV radiation).

Bonded radial ring

Bonded radial ring with cover foil

For readhead specifications see data sheets available at **RLS media center.**

Bonded radial ring with welded cover foil (cross section U)

Storage and handling

Storage temperature

–40 °C to +85 °C

Operating temperature

–40 °C to +85 °C

Humidity

High resistance to humidity

For higher operating temperatures **contact RLS**.

The magnetic ring should not be exposed to magnetic field densities higher than 25 mT on its surface, as this can damage the ring.

HANDLE WITH CARE

The use of industrial tools during installation or exposure to strong magnets such as a magnetic base is not recommended as it carries the risk of damaging parts of the system which as a result might not perform in accordance with specifications.

Use of tools such as drift, punch or similar are expressly forbidden and should not be used during installation to adjust run-out.

Improper assembly of the readhead and ring may impair function of the magnetic encoder system and lead to increased wear or damage to the system.

- All permissible distance and angle tolerances must be strictly complied with.
- The readhead may not come into contact with the ring over the entire revolution. The contact between the readhead and ring must also be avoided, to prevent ring from being damaged.
- Induction heating of the ring is expressly forbidden due to the possible damage of the magnetization pattern.
- The product should remain in the original packaging until ready for installation.

Chemical resistance

The use of alcohol for cleaning is considered safe, but it is not allowed to immerse the ring in alcohol. Furthermore, the ring surface print and drawn reference mark may disappear if the ring is not carefully cleaned. This does not apply for bonded radial ring with welded cover foil.

For more information on chemical resistance **contact RLS**.

Packaging

All MR radial rings except MR047B are supplied individually packaged in an antistatic box. Less than 20 off units of MR047B also come individually packed.

Part	Tray size	Box size
MR047B	8 units per tray	12 trays per box

A **RENISHAW** associate company

Accuracy of ring encoder systems

The accuracy of the ring encoder measurement is influenced by **encoder accuracy errors** and **installation-dependent errors**. In order to evaluate the total accuracy, each of the significant errors must be considered. Fig. 1 shows a typical accuracy error plot with marked particular influences.

Encoder accuracy errors

System error consists of a magnetisation error, crosstalk and SDE.

	System error [°]		System error [°]		System error [°]
Ring	Over the entire RH*	Ring	Over the entire RH	Ring	Over the entire RH
MR031	±0.16	MR057	±0.09	MR114	±0.05
MR040	±0.13	MR063	±0.08	MR123	±0.04
MR047	±0.11	MR081	±0.06	MR127	±0.04
MR050	±0.10	MR0101	±0.05	MR162	±0.03
				MR325	±0.03

*RH - Ride height

Magnetisation error

The magnetisation error is caused by imperfections in the elasto-ferrite material and possible deviations resulting from the magnetisation process. This error does not include eccentricity of mounting of the ring.

The following factors influence the result:

- the magnetic inhomogeneity of the elasto-ferrite layer,
- the ring installation tolerances during the magnetisation process,
- the measurement uncertainty of the magnetisation system during manufacturing process
- the quality of the magnetisation system.

Fig. 1 to Fig. 4 are for representation purpose only.

The magnetisation accuracy ${\rm A}_{\rm \scriptscriptstyle M}$ can be calculated by the following formula:

$$A_{M} = \pm \frac{4.6}{D}$$

where *D* is the outer ring diameter in [mm].

Crosstalk

Crosstalk is an undesirable effect of reference mark magnetisation on the incremental track magnetisation, which leads to accuracy peaks. It depends on both the ride height and the lateral offset.

An example of crosstalk is shown in Fig. 2.

Sub divisional error (SDE) or interpolation error

The sub divisional or interpolation error is a periodical accuracy error. It is influenced by the following factors:

- the length of poles,
- the homogeneity and cycle definition of magnetic poles,
- the sensing distance (ride height) of the installed readhead,
- the quality of the signal processing,
- the characteristics of the internal AMR sensor.

The SDE leads to speed ripples in applications where the encoder is used as speed feedback, e.g. in speed control loops. For radial rings, SDE is strongly influenced by ride height.

The maximum SDE at optimal sensing distance can be calculated by the following formula:

$$SDE = \pm \frac{0.58 \times K}{OD}$$

where:	OD (mm)	SDE (°)
SDE is Sub divisional error (°)	20	±0.029
OD is the outer ring diameter in (mm)	40	+0 014
K = 1 for magnetic rings with outer diameter >30	10	20.011
K = 2 for magnetic rings with outer diameter <30	60	±0.009

Hysteresis

Hysteresis is the difference in result of measuring the same point when approached from different directions.

It is known that ferromagnetic materials maintain their magnetised state in response to external fields, trying to change their direction.

The hysteresis in encoder systems depends on the strength of the magnetic field. A stronger magnetic field leads to a smaller hysteresis and vice versa. Therefore the hysteresis is strongly influenced by the ride height at which the readhead is installed (Fig. 3).

Fig. 3. Hysteresis vs. ride height (for encoder systems with 2 mm pole length).

Installation-dependent errors

Installation and adjustment of the ring and the readhead, in addition to the given encoder-specific error, normally have a significant effect on the overall accuracy of a system. Of particular importance are the installation eccentricity and the effect of deformations resulting from the ring installation.

Installation eccentricity

Eccentricity can be caused by the misalignment of the ring's center towards the rotational axis, as can be seen on Fig. 4. The error caused by eccentricity can be calculated by the following formula

$$E_{accuracy} = \pm 0.115 \frac{e}{D}$$

where $E_{accuracy}$ is eccentricity error in [°], *e* is misalignment of ring's center towards the rotational axis in [µm] and *D* is the outer ring diameter in [mm].

Fig. 4. Influence of installation eccentricity on accuracy.

Deformations of the ring during installation

By installing a ring to a non-ideally circular shaft, possible deformations can occur. These can have a significant influence on the system accuracy error.

Maximum speed table

Below are maximum speed values limited by the mechanical characteristics of the ring. For electrical characteristics please use **Ring speed calculator.** For higher speed **contact RLS.**

Magnetic ring design

Structure, appearance and markings

The position of the magnetised reference mark is always the same, on the engraved side of the ring as shown in the figure below.

The shape of the reference mark may vary. The image is for representation purposes only.

Magnetic ring surface markings (engraved)

All magnetic ring markings, except MR047B include serial number, QR code, logo, part number and reference mark. They are engraved on the hub. The reference mark engraving can deviate from the actual position of the reference mark magnetization for ± 5 °. The engraving is for orientation purposes only.

 $\supset \lhd$

```
Reference mark sign
```

Serial number example - unique combination of six letters and digits

Reference mark

Unique reference mark

The readhead must be ordered with reference mark option A (see corresponding readhead data sheet). The magnetic ring must be ordered with reference mark option A (see **Part numbering**).

The shape and position of the magnetised reference mark are critical so this option is only available as factory order.

Distance coded reference mark (DCRM)

The readhead should be ordered with reference mark option A. The distance coded reference mark option provides multiple reference marks that are individually spaced according to specific mathematical algorithm. Absolute position is calculated after traversing 2 succesive reference marks. Maximum length and minimum traverse depend on basic spacing (K) between reference marks. The magnetic ring must be ordered with reference mark option D (see **Part numbering**).

For more references on ring **contact RLS.**

A RENISHAW & associate company

Recommended ride height table

Installation at the recommended ride height results in better encoder system performance, such as lower SDE and higher accuracy. Please refer to the table below for the recommended ride height values. The readheads are calibrated at these values. The maximum range of installation tolerances for the ride height is shown in the drawings of the individual rings and readheads.

Readhead	LM10	LM13	RLM	RLC2IC	RLC2HD	RLB
Recommended ride height [mm]	0.3	0.3	0.3	0.3	0.3	0.3

For maximum range (ride height installation tolerances) please refer to individual ring and readhead drawings.

Installation by gluing

Make sure the installation surface is clean and free of debris. For more information see adhesive manufacturer's datasheet.

For all radial rings except MR047B

*Not provided.

**For the depth of the groove, please check the specifications of the adhesive (adhesive not provided).

For ring MR047B

A Cooperative **

*Not provided.

**For the depth of the groove, please check the specifications of the adhesive (adhesive not provided).

Installation by press-fitting

Make sure the installation surface is clean and free of debris. Slip the ring onto the mating shaft applying equal or uniform force along the whole ring circumference. For recommended shaft diameter (Dspd) see table on page 9.

For all radial rings except MR047B

*Not provided.

For ring MR047B

*Not provided.

Installation with fasteners

Installation with fasteners is possible with MR063G, MR081G, MR081U, MR114U, MR123G and MR325E rings. Make sure the installation surface is clean and free of debris. Rings need to be attached with fasteners as per the installation drawings (see appropriate ring page).

For recommended tightening torque see Table of recommended fasteners tightening torques available at **RLS media center**.

*M8 fasteners (not provided) for use with MR325E (ID240). M4 fasteners (not provided) for use with all other rings

This product is not designed or intended for use outside the environmental limitations and operating parameters expressly stated on the product's datasheet. Products are not designed or intended for use in medical, military, aerospace, automotive or oil & gas applications or any safety-critical applications where a failure of the product could cause severe environmental or property damage, personal injury or death. Any use in such applications must be specifically agreed to by seller in writing, and is subject to such additional terms as the seller may impose in its sole discretion. Use of products in such applications is at buyer's own risk, and buyer will indemnify and hold harmless seller and its affiliates against any liability, loss, damage or expense arising from such use. Information contained in this datasheet was derived from product testing under controlled laboratory conditions and data reported thereon is subject to the stated tolerances and variations, or if none are stated, then to tolerances and variations consistent with usual trade practices and testing methods. The product's performance outside of laboratory conditions, including when one or more operating parameters is at its maximum range, may not conform to the product's datasheet. Further, information in the product's datasheet does not reflect the performance of the product in any application, end-use or operating environment buyer or its customer may put the product to. Seller and its affiliates make no recommendation, warranty or representation as to the suitability of the product for buyer's application, use, end-product, process or combination with any other product or as to any results buyer or its customer might obtain in their use of the product. Buyer should use its own knowledge, judgment, expertise and testing in selecting the product for buyer's application, end-use and/or operating environment, and should not rely on any oral or written statement, representation, or samples made by seller or its affiliates for any purpose. EXCEPT FOR THE WARRANTIES EXPRESSLY SET FORTH IN THE SELLER'S TERMS AND CONDITIONS OF SALE, SELLER MAKES NO WARRANTY EXPRESS OR IMPLIED WITH RESPECT TO THE PRODUCT, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE, WHICH ARE DISCLAIMED AND EXCLUDED. All sales are subject to seller's exclusive terms and conditions of sale which, where the seller is (a) RLS Merilna tehnika d.o.o., are available at https://www.rls.si/eng/salesterms, (b) Renishaw, Inc., are available at https:// www.renishaw.com/legal/en/--42186, or (c) another person, are available on request, and in each case, are incorporated herein by reference, and are the exclusive terms of sale. No other terms and conditions apply. Buyer is not authorized to make any statements or representations that expand upon or extend the environmental limitations and operating parameters of the products, or which imply permitted usage outside of that expressly stated on the datasheet or agreed to in writing by seller.

RLS Merilna tehnika d.o.o. has made considerable effort to ensure the content of this document is correct at the date of publication but makes no warranties or representations regarding the content. RLS Merilna tehnika d.o.o. excludes liability, howsoever arising, for any inaccuracies in this document. © 2022 RLS d.o.o.
